

CAN-Sentinel Security Assessment Report

Generated: 2026-09-19 12:17:35

1. Executive Summary

CAN-Sentinel analyzed 255 CAN traffic records. 255 suspicious records were identified by the detection pipeline. The analysis classified threats into Low, Medium, High, and Critical severity levels.

2. Threat Severity Summary

Severity	Detected Events
Low	0
Medium	9
High	164
Critical	82

3. Security Alerts

Total security alerts generated: 255

4. Attack Timeline

Total suspicious events recorded: 255

Time	CAN ID	Event	Severity
1767265.2046	0x101	Abnormal Frequency	High
1767265.2048	0x103	Abnormal Frequency	High
1767265.2049	0x104	Abnormal Frequency	High
1767265.205	0x100	Abnormal Frequency	Critical
1767265.2051	0x101	Abnormal Frequency	High
1767265.2052	0x102	Abnormal Frequency	High
1767265.2053	0x103	Abnormal Frequency	High
1767265.2054	0x104	Abnormal Frequency	High
1767265.2047	0x102	Abnormal Frequency	High
1767265.21108	0x100	Abnormal Frequency	Critical

5. CAN ID Activity

CAN ID	Occurrences
256	99
257	39

258	39
259	39
260	39

6. Detected Event Types

Event Type	Occurrences
Abnormal Frequency	255

7. Detection Method

CAN-Sentinel uses a hybrid detection approach. Rule-based analysis evaluates CAN traffic frequency, timing, repetition, and payload characteristics. Machine learning analysis provides additional anomaly detection. The resulting evidence is combined to assign a threat severity level.

8. Conclusion

The CAN-Sentinel analysis provides a structured view of CAN bus security activity. Detected events are classified by severity and preserved in security alerts and an attack timeline. The generated report can be used as evidence for security analysis, testing, and project documentation.
